Wedler H., Wanbutt R.;

Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.

-I- CATALYTIC ACTIVITY: NADH + 2 Fe(3+) = NAD(+) + 2 Fe(2+).

-I- COFACTOR: FAD (PROBABLE).

-I- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

-I- SIMILARITY: BELONGS TO THE FRE / CYBB FAMILY.
                                                                                                                                                       the European Bioinformatics Institute. ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND
SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: SERTOLI CELLS AND OVARIAN GRANULOSA CELLS.
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
FSH/LSH/TSH SUBFAMILY.
SIMILARITY: CONTAINS 5 LEUCINE-RICH REPEATS (LRR).
                                                                                                                                                                                                             ADENYLATE CYCLASE.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Other proliferative disorders for which the modulators may used include lymphoma, leukaemia, melanoma, ovarian cancer, breast cancer, pancreatic cancer, liver cancer and lung cancer. The present sequence represents the open reading frame of a prostate specific protein, Six-Transmembrane Protein of Prostate 1, STMP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorder of the testis or prostate particularly prostate cancer, benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide for the diagnosis, prevention and treatment for prostate and testis disorders, particularly prostate cancer, comprises prostate-specific or testis-specific nucleic acids

                                                           Q
                                                                                                                                                                             The invention relates to substantially pure prostate-specific or classis-specific polypeptides and the nucleic acids encoding them. Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or treat disorders of the testis or prostate particularly prostate cancer, benign cryptorchidism, undescended, retractile, ascending or vanished testis. Other proliferative disorders for which the modulators may be cancer, pancreatic cancer, liver cancer and lung cancer. The present sequence encodes a prostate specific protein, Six-Transmembrane protein of Prostate 1, STMP1.
                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1394
```

```
The invention relates to substantially pure prostate-specific or testis-specific polypeptides and the nucleic acids encoding them. Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, benign cryptorchidism, undescended, retractile, ascending or vanished cancer include lymphoma, leukaemia, melanoma, ovarian cancer, breast cancer, pancreatic cancer, liver cancer and lung cancer. The
                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide for the diagnosis, prevention and treatment for prostate and testis disorders, particularly prostate cancer, compr prostate-specific or testis-specific nucleic acids
